Ear-Box Near-field Monitor

Ever wondered why your bass amp never seems to sound the same at different venues?

The answer is that your bass cabinet is heavily affected by the environment it is in and where you are standing in relation to it. What you hear is the sound of your speakers mixed in with the reflected sounds from walls, ceilings and floors. Basically your speaker has a different sound on and off axis and the further you are away from it the more sound energy that is reflected is blended into the sound. If the room acoustics are not ideal you know the sound you get is very uneven in response and muddy.

EQ is NOT the answer!

The EAR Box produces a near field sound that, when positioned close to you, will give you far greater clarity because it greatly increases the ratio of direct sound to the undesirable acoustics of the venue. It does not produce the full spectrum of a bass; it blends in with the low frequencies of your cabinet. Standing in front of your bass rig up close gives you the most clarity but at the expense of your audience. Your body will block the mid range and high soaking them up like a sponge. So your audience will hear a far more degraded sound than you.

Speakers: 2 x PJB Proprietary, Neodymium magnet 12 ohm drivers **Frequency Response:** 250 Hz - 20 KHz **Impedance:** max 340 Ohms at 20 Hz to min 24 ohms at 1 KHz
Speaker Connector: Neutrik NL 4 **Finish:** Black epoxy splatter **Dimensions (WxDxH):** 6.75 x 3.75 x 5.75 **Weight:** 2.4 lbs

HEADPHONES

H850

Not all headphones are suitable for bass instruments. Many may sound good for casual listening, but plug them into the headphone jack of a bass amp and you will soon find their limitations. PJB H-850 headphones are the first pair designed specifically to bridge the gap between high-quality music and deep and clear bass.

Frequency Response: 20Hz~20KHz **Impedance:** 32Ohms
Maximum Input Power: 1000mW
Sound Pressure Level (SPL): 96dB **Cable length:** 2m/
Replaceable
